Overview: R

Workshop on Plotting in R

Lokesh Mano • 08-Sep-2021
NBIS, SciLifeLab

Contents

Reading files

- Errors while reading in files!
- Demo of things that could go wrong when reading in files into R
- Demo on using reserved variables like `T`, `F`, `character` and many others ...
- How can you check if something is a reserved variable?

Special operator

- `%>%`
  - from the `dplyr` package
  - works like a pipe

```
read.table("data/counts_raw.txt", header = T, row.names = 1, sep = "\t") %>%
  head(6)
```

```
##                 Sample_1 Sample_2 Sample_3 Sample_4 Sample_5 Sample_6 Sample_7

##                 Sample_8 Sample_9 Sample_10 Sample_11 Sample_12
## ENSG00000000003      523      450       950       760      1436
## ENSG00000000005        0        0         0         0         0
## ENSG00000000419     1041      796      1036       789      1413
## ENSG00000000457      125       74       108       115       174
## ENSG00000000460      505      398       141       168       259
## ENSG00000000938        0        0         1         0         0
```

Special operator

- `%>%`
  - from the `dplyr` package
  - works like a pipe

```
read.table("data/counts_raw.txt", header = T, row.names = 1, sep = "\t") %>%
  head(6) %>%
  rownames_to_column(var = "Gene")
```

```
##              Gene Sample_1 Sample_2 Sample_3 Sample_4 Sample_5 Sample_6
## 1 ENSG00000000003      321      303      204      492      455      359
## 2 ENSG00000000005        0        0        0        0        0        0
## 3 ENSG00000000419      696      660      472      951      963      689
## 4 ENSG00000000457       59       54       44      109       73       66
## 5 ENSG00000000460      399      405      236      445      454      374
## 6 ENSG00000000938        0        0        0        0        0        1
##   Sample_7 Sample_8 Sample_9 Sample_10 Sample_11 Sample_12
## 1      376      523      450       950       760      1436
## 2        0        0        0         0         0         0
## 3      706     1041      796      1036       789      1413
## 4       60      125       74       108       115       174
## 5      316      505      398       141       168       259
## 6        0        0        0         1         0         0
```

Special operator

- `%>%`
  - from the `dplyr` package
  - works like a pipe

```
read.table("data/counts_raw.txt", header = T, row.names = 1, sep = "\t") %>%
  head(1) %>%
  rownames_to_column(var = "Gene") %>%
  gather(Sample_ID, count, -Gene)
```

```
##               Gene Sample_ID count
## 1  ENSG00000000003  Sample_1   321
## 2  ENSG00000000003  Sample_2   303
## 3  ENSG00000000003  Sample_3   204
## 4  ENSG00000000003  Sample_4   492
## 5  ENSG00000000003  Sample_5   455
## 6  ENSG00000000003  Sample_6   359
## 7  ENSG00000000003  Sample_7   376
## 8  ENSG00000000003  Sample_8   523
## 9  ENSG00000000003  Sample_9   450
## 10 ENSG00000000003 Sample_10   950
## 11 ENSG00000000003 Sample_11   760
## 12 ENSG00000000003 Sample_12  1436
```

Tidyr or dplyr functions

- `gather()`
  - converts wide to long format
  - `key` is usally what you measure: `-Gene`
- `select()`
  - you can choose which columns you want,

Thank you. Questions?

R version 4.1.1 (2021-08-10)
Platform: x86_64-pc-linux-gnu (64-bit)
OS: Ubuntu 18.04.5 LTS
